

Higher Education Performance Dashboard

University ranking and KPI analytics using QS & THE datasets

Presented by

Ambika Kumari Jha

University Overview	Research Analytics	Student Analytics	Country Comparison
---------------------	--------------------	-------------------	--------------------

One Question, Many Ranking Indicators

Higher education data is distributed across different ranking sources, making it difficult to compare universities, interpret research performance, understand student-related indicators, and identify country-level patterns.

The project addresses this challenge by bringing ranking indicators into a connected Tableau dashboard suite.

One Connected Dashboard Suite

EduVision DV combines ranking data, prepares consistent analytical fields, creates KPI measures, and presents the results through four connected dashboards.

01 Combine Bring QS and THE ranking data together	02 Clean & Standardize Prepare fields for analysis	03 Engineer KPIs Create measures and comparisons	04 Visualize Build four interactive dashboards
--	---	---	---

Outcome: a portfolio-ready Tableau workbook that supports interactive exploration of university performance.

What Powers the Dashboards

QS World University Rankings Ranking, reputation, research, employment, internationalization and sustainability indicators. THE World University Rankings Ranking, teaching, research environment, research quality, industry impact, international outlook and student-related fields.		
Python + Pandas Data loading, cleaning, transformation and validation	Jupyter Notebook Exploration and preparation workflow	Tableau Visualization and dashboard development

From Raw Rankings to Insight

The workflow moves from source data preparation to calculated indicators, visual storytelling, navigation, filters, and validation of the final workbook.

The KPI Cards at a Glance

The dashboards use a consistent KPI header to give users an immediate summary before they explore individual charts.

Total Universities 2,947	Total Countries 134	Average Overall Score 30.52	Average Ranking 2,198
-----------------------------	------------------------	--------------------------------	--------------------------

These KPI values are presented as shown in the supplied dashboard screenshots and are intended to provide a common summary across dashboard pages.

Four Views, One Analytical Story

University Overview Overall performance, university distribution, internationalization and reputation comparison.	Research Analytics Research score, citations, faculty research and reputation-related patterns.
Student Analytics Student performance, student-faculty ratio, international performance and diversity.	Country Comparison Country-level performance, maps, citations, research and student indicators.

Every view uses the same navigation and filter approach, making it easier to move from a general summary to a focused analysis.

University Overview

A high-level view of top university performance, university distribution, internationalization, KPI comparison, reputation and ranking groups.

Research Analytics

A research-focused view covering research performance, citations, faculty research, research area distribution and reputation relationships.

Student Analytics

A student-focused view covering student performance, student-faculty ratio, student distribution, international performance and diversity.

Country Comparison

A geographic and country-level view covering overall score, citations, research performance, student distribution and KPI comparisons.

What the Dashboard Helps Explore

The dashboards are designed to help users explore patterns across multiple dimensions instead of relying on one ranking number.

University level Compare overall scores, reputation indicators, ranking groups and internationalization.	Research level Examine research score alongside citations, faculty research and reputation measures.
Student level Explore student performance, student-faculty ratio, international indicators and diversity.	Country level Identify geographic variation through maps and country-wise comparisons.

The visuals support exploratory comparison; interpretation should consider the definition, scale and source of each indicator.

From Data to a Clearer View of Higher Education

EduVision DV brings QS and THE ranking information into a structured, interactive dashboard experience. The project combines data preparation, KPI design and Tableau visualization to support university, research, student and country-level analysis.

Project deliverable

A connected four-dashboard Tableau prototype with shared filters, navigation and KPI cards.

Future enhancement

Add a detailed data dictionary, document calculated fields, validate source definitions and include dashboard-specific insight notes.

Thank You
